Co-Operative Healing

by Mark L. Gallert (MD, MSc)

I. The Central Theme

This term refers to therapeutic effects obtained by applying wire circuits to connect one part of a person's body with another part, or to connect a area of one person's body with an area of another persons body. L.E. Eeman, in his exhaustive research into this type of circuit as detailed in his book *Co-Operative Healing*, utilized these connections in pairs so that there would be complete electrical circuit.

The basis of the flow effects obtained by use of these circuits, was the discovery that human bodies give evidence of being bipolar, along three axes : --- Head to feet; Right side to left; Back to front.

When polar opposites are connected together, whether within one body or between two or more bodies, the effects noted include greater relaxation, recovery from fatigue and disease, greater capacity for work, better health in general. Circuits connecting polar opposites are termed Relaxation Circuits.

When polar similar are connected together, the effects noted are the creation of tension, and th opposites of all the advantages obtained from Relaxation Circuits. Circuits connecting polar similars are termed Tension Circuits.

The use of these circuits have been found to affect not only functional physical and mental conditions but also organic conditions.

In people born right-handed, the head and right side have been found to have the same polarity, which by convention has been termed positive. In these individuals, the base of the spine, and the left hand share the same polarity. Polarities are reversed in those born left-handed.

Eeman and coworkers performed thousands of carefully documented experiments under controlled conditions over a period of years, establishing the effects of a wide variety of these circuits, ad ruling out the possibility of effects through suggestion or other extraneous influences. For more detail, see his book *Co-Operative Healing* (London 1947, Frederic Muller Ltd).

2. One Person In Circuit

The diagram (Fig 1) shows the circuit. Two metal handles each connect through approximately 10 ft of insulated copper wire, to copper screen mats about a foot square. The individual lies on his back with the copper mats under his head and base of spine.

Fig. 1

One subject in relaxation circuit, showing copper gauze mats and wire connections.

For right-handed individuals, a relaxation circuit is formed if the left hand holds the handle connecting to the mat under the head, and the right hand holds the handle connected with the mat under the bottom of the spine. Average duration of exposure is half an hour.

Likewise for right-handed individuals, if the handles are switched so that the left hand holds the handle connecting to the mat under the bottom of the spine, and the right hand holds the handle connecting to the mat under the head, a tension circuit is formed. These effects are noted even if the individual is not aware of the specific connections or if the connections are changed out of range of his vision and without his knowledge. One of the reasons for the 10-ft length of connection wires, is to permit changes of connection without the subject's knowledge, in order to test the effect of suggestion. In almost all instances, the reactions are those appropriate to the circuit rather than to the suggestion given, if the suggestion is contrary to the effect of the circuit.

Many case reports covering various types of ailments are detailed in the book *Co-Operative Healing*, and will not be repeated here. Among the ailments relieved by these circuits are listed: mental, nervous, circulatory, respiratory, digestive and eliminative disorders; headaches, high blood pressure, rheumatism, lumbago sciatica and many other conditions. Insomnia appeared particularly to be relieved.

Eeman states:

'The relaxation circuit almost invariably produces a progressive sense of muscular relaxation, warmth, well-being and drowsiness, often culminating in sleep, slower and stronger pulse, slower and fuller respiration, with more complete deflation, progressively longer pauses between deflations and inflations, and a lowering of the pitch of the voice.'

The Tension Circuit reverses the above reactions and eventually leads to varying degrees of tension, restlessness and discomfort.

It was found that direct contact between the copper mats and the individual was not necessary in order to produce the effects noted; clothing and even cushions did not act as barriers.

3. Two Persons in Circuit

The effects of both Relation and Tension Circuits are usually increased if two persons are connected with each other, using a separate pair of copper mats for each person.

The normal Relaxation Circuit is formed when the head of each person is connected to the left hand of the other person, and the bottom of the spine of each person is connected to the right hand of the other person. See Fig 2.

Fig. 2
Two subjects in closed relaxation circuit. Each subject with left hand (-) to head (+) and right hand (+) to spine (-) of other subject.

It was found that sex made no difference in polarity --- the same circuit being applicable to two men, two women, or one man and one woman. However, left- and Right-handedness does make a difference in polarity. When a right-handed person is placed in circuit with a left-handed person, then the Relaxation circuit is formed when the head of each person connects with the right hand of the other person, and the bottom of spine of each person connects with the left hand of the other person. Also, the left-handed person should lie in the opposite direction from the right-handed one.

Reports from the experiments indicate the rather curious fact that when a strong or well person is placed in circuit with a weak or ill person, both experience beneficial effects from the experience. Sleep for half an hour or more will frequently visit both subjects.

Another interesting fact that emerged from the tests, is that a Tension Circuit tends to produce discord and antagonism between the two participating subjects, and this antagonism is then dissipated if a Relaxation circuit is used.

4. Three or More Persons in Circuit.

The same principles were found to apply with three or more persons in circuit --- in fact the number of persons could be increased indefinitely. However, with the addition of more individuals in the circuit, additional phenomena appeared; some individuals turned out to be stronger 'emitters', other individuals acted more as 'receivers', while others seem to have as the primary characteristic, that of being 'conductors'. For a detailed account of these characteristics, refer to Eeman's book *Co-Operative Healing*, Chapter IV.

Figure 3 shows a Relaxation Circuit between three individuals; the same circuit can be expanded to include any desired number. This is termed a 'series' type of circuit.

Fig. 3

For multiple use (three or more persons in circuit at one time), two principles emerged as the best ones to use --- diagrammed in Figs 4, 5 and 6.

In Fig 4, all the heads connect together all spines connect together, and those then are connected with each other, All right hands connect together, all left hands connect together, and those two sets are likewise connected with each other.

Fig. 4

All Heads to all Spines and all Rights to all Lefts, in pure parallelism.

In Figure 5, all heads and all left hands connect together, and all spines and all right hands connect together.

Fig. 5

All Heads to all Lefts and all Rights to all Spines, in pure parallelism.

5. Conclusions

It would appear from the Eeman experiments, that human beings emit, emanate or radiate a particular kind of current or impulse, which can be channeled with wire connections and used to produce either healing effects or adverse effects, depending upon polarity.

6. Drug Tests

One of the most interesting aspects of the Eeman research, was the series of tests in which a relaxation Circuit was established for one or several persons, and the circuit was broken by test vials placed in the circuit one at a time, each vial containing two electrodes immersed in a drug or medicinal solution. The vials were inserted out of range of the vision of the subjects, and they did not at any time have any knowledge of the names or characteristics of the test substances. Yet within a short time after the

substance had been inserted, the subjects experienced physiological changes and symptoms, which almost always were representative of the effects engendered by the drug or substance used in the test. If the subjects were kept in circuit with a substance for too long a time, there were instances where the symptoms or physiological effects became very acute and severe.

Some of the tests were run with coded vials, so that the operator would not know what substance was in use at any given time, and so could not have had telepathic influence over the minds of the subjects. These tests, conducted to rule out the possibility of telepathic effect, proved just as positive in results as the tests conducted when the operator (though not the subjects) knew what substances were being tested.

Fig 6 shows a Relaxation Circuit of drug tests.

Fig. 6

Relaxation circuit using hands only in parallel, with drug in series.

The implications of these tests tend to confirm the hypothesis, previously stated by others, that all substances radiate and that these radiations can be carried on wires.

Borderland Sciences Research Fdn [Undated, early 1980s]

Eeman Screens

Put yourself in a Relaxation Circuit using your own energies for increased well being.

Any arrangement which connects polar opposites of one or of different bodies by means of electrical conductors is referred to as a Relaxation Circuit.

FIG. 1.—One subject in relaxation circuit, showing copper gauze mats and wire connections.

Eeman Screens connect the positive and negative poles of the body, promoting muscle relaxation and stimulating body function.

They can be used for fostering sleep, recovery from fatigue and disease and for increasing your capacity for work and health.

The relaxation circuit affects not only organic but also nervous and mental health.

For experiments with one person, the handle in the left hand (-) is connected with a copper gauze screen beneath the head (+), and the right hand (+) is connected with another screen beneath the base of spine (-).

FIG. 3.—Two subjects in closed relaxation circuit. Each subject with left hand (—) to head (+) and right hand (+) to spine (—) of other subject.

Several people can be connected together through the relaxation circuit. Also research done by healers has shown the effectiveness of linking healer and patient (as shown below).

FIG. 4.—Relaxation circuit between right-handed healer and right-handed and left-handed patients.
